

Mechanics of Use

When the ladder exerts a downward force (x),
the Ladder-genie grips at point (1) and counteracts the force (x).

When the ladder exerts an outward force (y),
the Ladder-genie grips at point (2) and also counteracts the force (y).

The combination of the grips at points (1) and (2) result in the
Ladder-genie feet at point (3) pressing against the floor,
thus preventing the ladder from slipping.

For a practical demonstration of the effectiveness of this device,
click on the video links on the Ladder-genie website.
